Abstract (en)

[origin: EP2242211A1] The present invention provides an apparatus for enabling a wireless local area network device to access a WiMAX network, the apparatus comprises: WiMAX means, configured to encapsulate uplink data from data means into a transmission message in an 802.16e protocol format, to send the transmission message to a WiMAX base station, to re-encapsulate a received message from the WiMAX base station into downlink data that can be processed by the data means and to send the downlink data to the data means; the data means, configured to receive the downlink data from the WiMAX means and the uplink data from WLAN means and to perform processing to the uplink data and the downlink data; and the WLAN means, configured to encapsulate the downlink data received from the data means into a downlink data message in an 802.11a/b/g protocol format, to send the downlink data message to a terminal device, and to re-encapsulate the uplink data message received from the terminal device into the uplink data that can be processed by the data means. The present invention also provides a method for enabling a wireless local area network device to access a WiMAX network. Therefore the facile movement in a local area is achieved.
