Abstract (en)
[origin: WO2009084997A1] The present invention concerns an automatic water dispenser that automatically supplies water via a valve (6) to a container (1). Additional liquid can with the reverse valve (10) be chosen from receptacles (4, 5) that via a dosing feeder (7) conveys the liquid via a water conduit to the container (1). The number of times the container is filled is registered by a counter (9). The water distributor (11) in its downward position locks the container (1) in the cradle (2) and the water distributor (11) in its upright (inward) position with a full container locks the cradle in the stand (3) whereby the valve (6) is secured in its closed position. This allows for the removal of the container (1) for cleaning.
