Abstract (en)

[origin: WO2009089817A1] The aim of the invention is to develop a generic fuel cell system having a stack and an associated method for changing the stack, wherein no fuel can escape from the feed lines to the connections of the stack, particularly during the transport and changing of the stack. The aim is achieved in that the fluid-bearing connections (7') of the stack (3) each have at least one valve. Such fuel cell systems are used to supply energy to electrical consumers.
