Abstract (en)

The present invention concerns a sailing boat 1 comprising a hull 2 and a supporting mast 3 for at least a sail and characterized in that the mast is pivoted to the hull in such a way as to be able to vary its inclination angle with respect to the surface of the hull. The connection between the mast and the hull is realized through a spherical joint 7 or connection stand 107. Moreover, adjustment means 12 connected from the hull to the mast allow to vary the inclination angle of the same when required. In such a manner, it is possible for the crew to vary the lift during all the sailing.
