Abstract (en)

[origin: WO2009058039A1] A tilting and turning window opened outside from the room, moving about tilting hinges located at the upper part of the window, or about turning hinges located lower, preferably in the central zone of the window. It incorporates an intermediate assembly between the window frame and the sash, advantageously in the form of two intermediate arms (3), each of which is connected with the window frame (1) by a tilting hinge. One subassembly of that hinge has an arched guide (4), and the second an arched slide (5) placed in that guide. The window is provided with a locking mechanism preventing opening the window in the turning mode when is being opened in the tilting mode, and prevents opening in the tilting mode when it is being opened in the turning mode.
