Abstract (en)

[origin: WO2009053746A1] A cooling device is based on the cooling effect exhibited by high-voltage, 4-4.5kV, unidirectional pulses discharging across a spark gap (2-13) in less than 100 ns. The cooling effect is extended spatially by an emitter (2-12) comprising two (3-2,3-4) coaxial metallic tubes that are electrically isolated from the spark gap electrodes. Such a device is particularly suitable for air conditioning in both residential and transport applications.
