Abstract (en)

[origin: WO2009103180A2] The invention relates to a method for stabilising the spectrum of a pulsed coherent optical source that comprises controlling the offset frequency ω_0 and the repetition rate τ_r in order to stabilise the frequencies of the comb lines constituting the optical spectrum thereof. The method comprises forming, from the pulsed coherent optical source (S1), a beam that is directed onto a reference resonant optical cavity (CR), and using the signal generated by the reference resonant optical cavity (CR) for controlling the offset frequency ω_0 or the repetition rate τ_r , and probing, using a comb line, an atomic or molecular transition (AMT) in order to generate a driving signal for the repetition rate τ_r or the offset frequency ω_0 .
