Abstract (en)
The invention relates to a paper dispenser, comprising two concentric tubes (1-2), both provided with a longitudinal window (11-21). The inner tube has a series of sheets of paper (4) folded into a horseshoe shape and facing one another, forming a stack from which the sheets are extracted one by one by pulling the top sheet which projects through a longitudinal opening (21). Two side covers (3) close said inner cylinder, hold the group of sheets of paper (4) therein and allow gripping it with only two fingers while the outer surrounding tube (1) is rotated in order to place the grooves (11-21) facing one another when a sheet of paper is to be extracted, or to conceal the inner groove (21) in the blind area of the outer cylinder (1) so as to also conceal the end of the paper (4) and prevent its extraction in that position.
