Abstract (en)
[origin: EP2248950A1] The beacon has a restraining foot implanted at an end of a rectangular vertical signaling panel (1). A transverse semi-cylindrical open box (3) is opened on a visible face of the panel. The foot is formed by another open box (4). An opening i.e. concavity (4a), is turned on a side of another visible face of the panel. One of ends of the foot crosses the former box at a medium of the former box. T-shaped hollow beams are located at a removable base of the panel. The beams project on the latter face of the panel, where the beacon is formed by a thin sheet i.e. injected plastic.
