Abstract (en)

[origin: EP2248966A1] The door lock (1) has a switching element (14) whose activation position is associated with closure element drives in an activated condition at which closure elements (4, 5) are transferred by an actuating member from a closing condition to an opening condition. A deactivation position of the switching element is associated with the drives in a deactivated condition in which the closure elements are not transferred from the closing condition to the opening condition. The switching element is pressured in the direction of the deactivation position and operated in the activation position.
