Abstract (en)

[origin: EP2251099A2] The device (1) has a cylindrical visible zone (24) arranged along an axis (8). A distributor channel (9) is provided for supplying visible air (15') and extends over the circumference of the cylindrical visible zone, where flow cross section of the channel is reduced in a flow direction. The visible zone and the distributor channel are separated from each other via an inner wall (12), which possesses passage openings for entry of the visible air into the visible zone. A goods inlet is attached axially at the cylindrical visible zone.
