Abstract (en)  
[origin: WO2009092368A2] The invention relates to a closure for closing preferably handbags, furniture, doors, and comparable objects, made of a first closure module and a second closure module having the following characteristics: a magnetic keeper design pulling the closure module 1 and the closure module 2 together in the direction of closure, closure module 1 and closure module 2 being rotatable or displaceable for opening in opening direction Y lateral to closing direction X, a locking device having at least one spring locking element made of an engaging protrusion and a spring, wherein the locking piece pushes to the spring locking element the side in a direction Z when closing and then engages with the engaging protrusion, and wherein, the locking piece and the spring locking element are pushed against each other from an engagement position to a non-engagement position when displacing the closure module 1 and the closure module 2 in the opening direction Y, wherein the spring of the spring locking element is designed and disposed so that it comprises a double function, namely that the spring deflects by bending lightly in the direction Z when closing, but the spring is rigid in bending under load on the closure opposite the closing direction X.
