Abstract (en)

[origin: EP2254366A1] To improve throughput by reducing the resource used for transmitting a parameter relating to retransmission control and decreasing the overhead of retransmission control signaling. In a case where a retransmission control method is employed in consideration of adaptive MCS control in which the encoding rate can be changed, the scheduling section sets the MCS in accordance with CQI notified from the communication counterpart apparatus. When transmission data is encoded, the RV parameter bit-number setting section sets the number of bits used for signaling the RV parameter to decrease as the encoding rate of the first transmission is decreased and sets the RV parameter based on the number of bits. For example, in a case where the encoding rate R is $R > 2/3$, two bits are set. In a case where the encoding rate $1/3 < R \leq 2/3$, one bit is set. On the other hand, in a case where $R \leq 1/3$, zero bits is set.
