Abstract (en)
[origin: WO2009112398A2] The invention relates to a system for data correlation, having: a receiving device 1 having an image acquisition element 10 and a data set generator 12 for generating at least one object data set from at least one acquired first image, which represents a physical object, and an identification label, which uniquely determines an object-related acquisition procedure, and at least one information data set from at least one acquired second image, which represents coded information related to the physical object, and the identification label; a correlation device 2 for the extraction 20 of the coded information from the information data set, for the semantic analysis 22 of the extracted information, and for the generation of at least one combination data set e from the results of the semantic analysis, the extracted information, and the at least one object data set with the same identification label as the extracted information data set; and a user device 3 for the storage and further use of the combination data set.
