Abstract (en)

[origin: EP2255905A1] The device for carrying out a process under heat effect in a metallurgical container (1), comprises a movable carrier device (2) in the area of a furnace platform or processing platform (3) with a telescope arm pivotable in the carrier device, and a processing means (5) arranged with the carrier device in the interior of the metallurgical container. The processing means is controllably rotatable and/or pivotable related to its longitudinal axis on cantilever and activatable function means are positioned and/or positionable on the processing means. The device for carrying out a process under heat effect in a metallurgical container (1), comprises a movable carrier device (2) in the area of a furnace platform or processing platform (3) with a telescope arm pivotable in the carrier device, and a processing means (5) arranged with the carrier device in the interior of the metallurgical container. The processing means is controllably rotatable and/or pivotable related to its longitudinal axis on cantilever and activatable function means are positioned and/or positionable on the processing means. The function means are mountable with a connection- or tensioning device on the processing means in the area of the furnace platform in a magazine, and detachable from the area of the furnace platform. The processing means comprise more than two function means and arrangements for measuring the interior surface (11) of the metallurgical container, applying incombustible mass on wall area and base area, measuring temperature of the melt and/or slag and/or wall, removing sample, introducing sealing means for the tap hole, and for reducing the crusts from the slag.
