Abstract (en)

[origin: EP2256273A2] The lock has a central lock (1) connected with an additional locking device (2) over a driving rod (4). An additional lock chain of the additional locking device operates over the rod on a central lock chain. The additional lock chain transfers a central bar of the central lock from a release position into a locking position in the course of self-locking of the additional locking device. The central lock chain operates over a pivotally supported locking lever on the central bar. The lever has a control surface on which an actuating element e.g. actuating cam, operates.
