Abstract (en)
[origin: EP2256450A2] The exchanger has a collector box (2) provided with a set of substantially parallel tubes on an output side, where the tubes open into the collector box on the output side. A gas flow flows from the tubes into the collector box and from the collector box into an outlet (2a) of the collector box. Structures (15, 16) cooperate with the gas flow and are provided at one of the tubes or the collector box such that a condensation is transported to the outlet by the structure.
