Abstract (en)
[origin: WO2009105916A1] A switching device (12) comprising at least one first contact member (14) being moveable relative to at least one second contact member (16) to reversibly electrically contact the at least one second contact member (16), wherein at least one latching means (22) is adapted to hold the at least one first and second contact members (14, 16) in electrically conducting contact, to a method of assembling such a switching device (12) comprising the step of mounting to the switching device (12) at least one latching means (22), and wherein the latching means (22) is provided for at least partially holding the first and second contact members (14, 16) in electrically conducting contact, when activated, to a method of operating such a switching device (12), wherein the at least one latching means (22) is holding the at least one first and second contact members (14, 16) in electrically conducting contact, when activated, to an electrical circuit comprising at least one such switching device (12) and to an electrical device comprising at least one such switching device (12) and/or the electrical circuit.
