Abstract (en)

[origin: EP2261876A1] The method involves assigning switching variants by a temporal-local sequence of switching signal programs (SPU) for junctions (Kn). The switching variants are evaluated with respect to traffic-technical evaluation criteria, where efficiencies of the relevant signal group resulting from the switching signal programs of the switching variant are considered as evaluation criterion. The switching variant is implemented traffic-technically with respect to the evaluation. An independent claim is also included for a device for switching signal programs for light signal-controlled junctions of a road network.
