Abstract (en)

The method involves automatically declaring a secure profile at an initiative of an application software of a user agent (UAC) situated in a unsecure medium. A RFC3840 consistent to deceleration of capacities is extended for the secure profile. A call switching algorithm is provided by a call server (SER) according to the declared profile in response to the call emanating from a user agent (UAA) situated in a secure medium towards the user agent situated in an unsecure medium. An independent claim is also included for a device for managing secure electronic communications along a session initiation protocol.

Abstract (fr)

Le dispositif de gestion de communications électroniques sécurisées selon le protocole SIP comprend des moyens (SER) aptes à déclarer un profil sécurisé conforme au protocole SIP, à l'initiative et au profit d'un agent utilisateur choisi (UAA) et des moyens d'aiguillage aptes à aiguiller l'appel vers ce profil sécurisé en réponse à un appel émanant dudit agent utilisateur (UAA) situé en milieu sécurisé vers un agent utilisé situé en milieu non sécurisé (UAC).
