Abstract (en)
[origin: WO2009106137A1] A closure (1) for closing containers (16) consists of a cap cover (3), a ring-shaped head part (2) with a central axis (M), and a pivot part (4), wherein the cap cover (3) extends away from the head part (2) in the direction of the central axis (M), and wherein the cap cover (3) has a tear-open segment (3a) which runs peripherally with respect to the central axis (M), wherein the pivot part (4) is connected to the tear-open segment (3a) and extends in the same direction as the central axis (M), wherein the tear-open segment (3a) has a thin portion (5a) abutting the head part (2) and running peripherally with respect to the central axis (M), the thin portion forming a rotational axis (D), and wherein the pivot part (4) has a stop (4a) which runs in the same direction as the central axis (M) at least to the area of the rotational axis (D), wherein the stop (4a) is constructed in such a manner and so distanced from the head part (2) that a pivoting of the pivot part (4) about the rotational axis (D) causes the stop (4a) to abut the head part (2).
