Abstract (en)

[origin: CA2713644A1] The invention relates to an antenna arrangement for RF systems, comprising at least two antenna coils (40; 41) disposed over each other in two different layers and thereby not touching each other, wherein a first antenna coil (40) is disposed offset from a second antenna coil (41), and the counterinductivity between the two antenna coils (40; 41) is minimized. The invention further relates to an RF component having such an antenna arrangement, whereby one of the antenna coils is a low-band power coil (40) disposed on the surface of the carrier (30) offset to a wide-band data coil (41). The invention further relates to an electronic device having such an RF component. The electronic device is particularly an electronic display on the basis of electronic ink having bistable elements, wherein the electronic display (70) comprises an RF component (10) for non-contact transmission of power and data to the electronic display (70).
