Abstract (en)
[origin: EP2264293A1] The obturator (36) has a truncated face (42) for guiding a channel (14) during its introduction at the interior of a hubcap (18), where the obturator is adapted to be elastically deformed in response to displacements of the channel with respect to the hubcap during functioning of an engine. The channel is displaced with respect to the hubcap through a gap (J) without hitting the hubcap during functioning of the engine. An independent claim is also included for an end of an exhaust line of a combustion engine, comprising a channel.
