Abstract (en)  
[origin: EP2266762A1] A technique for reducing the costs of manufacturing an auxiliary handle provided separately from a main handle in a hand-held power tool is provided. A hand-held power tool (101) includes a power tool body (103) having a front end region to which a tool bit (119) can be mounted, a main handle (109) that is disposed on a rear end side of the power tool body (103) opposite from the tool bit (119), an auxiliary-handle mounting member (108) for mounting an auxiliary handle (110), and longitudinally elastic elements (151, 152) that are disposed between the power tool body (103) and the auxiliary handle mounting member (108) in the axial direction of the tool bit (119) and can elastically deform in the axial direction. The auxiliary-handle mounting member (108) is allowed to move with respect to the power tool body (103) in the axial direction of the tool bit (119) by elastic deformation of the longitudinally elastic elements (151, 152), so that transmission of vibration from the power tool body (103) to the auxiliary-handle mounting member (108) in the axial direction is reduced.
