Abstract (en)

[origin: EP2266903A2] The method involves dividing a support roller (3) into multiple sections (4) in an axial direction (y), where each section acts on a roll (9) to be wound under formation in a pressure direction. The pressure direction of the sections coincides at starting of a winding process, and the pressure direction of the sections is occasionally different from each other in ending of the winding process. An independent claim is also included for a roll winding device comprising a support roller.
