Abstract (en)

[origin: EP2266913A1] The device has two supporting parts (1) that are moved relative to one another, and a hydraulic operating element (3) with two work chambers (4), where the operating element is firmly connected with one of the supporting parts and is supported in the other supporting part. The operating element adjusts the supporting parts relative to one another by moving. An actuating element is connected with the work chambers of the operating element, where a controller provides the actuating element such that one of the work chambers is connected with a tank line.
