Abstract (en)

[origin: EP2267645A2] The authenticating method involves exploiting first data and second data respectively measured for a first resistive load value and for a second resistive load value relative to the level of direct current voltage after receiving the first data relative to the current in the oscillating circuit of a terminal (1). The current is measured by the terminal for the first value of the resistive load of a transponder (2). Independent claims are included for the following: (1) an electromagnetic transponder e.g. chip card, electronic transport ticket, electronic passport, mobile phone, personal digital assistant, electronic tag; and (2) a terminal.
