Abstract (en)

[origin: EP1132871A2] The building controlled access system has at least one access control point which is programmed and/or monitored via a local node device (1) adjacent the access control point, with a radio link used for data communication between them and between the local node device and a central node device (2), e.g. via a number of relay node devices (3) between the local node device and the central node device. An Independent claim for a data exchange method within a building controlled access system is also included.
