Abstract (en)
[origin: EP1705671A2] A rare earth permanent magnet is in the form of a sintered magnet body having a composition $R_1 a R_2 b T c A d F e O f M g$ wherein F and R 2 are distributed such that their concentration increases on the average from the center toward the surface of the magnet body, the concentration of $R_2 / (R_1 + R_2)$ contained in grain boundaries surrounding primary phase grains of (R_1, R_2) 2 T 14 A tetragonal system within the sintered magnet body is on the average higher than the concentration of $R_2 / (R_1 + R_2)$ contained in the primary phase grains, and the oxyfluoride of (R_1, R_2) is present at grain boundaries in a grain boundary region that extends from the magnet body surface to a depth of at least 20 μm . The invention provides R-Fe-B sintered magnets which exhibit high magnet performance despite minimal amounts of Tb and Dy used.
