Abstract (en)
[origin: WO2009128762A1] The present disclosure relates to a vacuum cleaner nozzle (1) comprising a housing having a cleaning surface, configured to face a surface to be cleaned. One or more main brushes (17, 19) can be manoeuvred between a first and a second position by means of a pedal on the nozzle. In the first position, the main brushes project downwardly from the cleaning surface and in the second position the main brushes are retracted. The nozzle further comprises at least one auxiliary brush (21, 23) which is arranged to move corresponding to the main brushes and which projects, in the first position, towards the surface to be cleaned in an inclined manner and extends beyond the edges of the cleaning surface, such that the auxiliary brush is visible from above the nozzle.
