Abstract (en)
[origin: WO2009115325A1] A showerhead housing (1) contains multiple jet outlet elements (6), each having multiple diagonally running passages (24), which form jet openings. The jet outlet elements (6) are mounted rotatably in the housing (1) and are set into a slow revolution by a water-driven rotor via a reduction gear. Because of the diagonal course of the passages (11), the jets exiting from the showerhead thus execute specific movements, which can be visually recognized by the user of the shower. The jet outlet elements (6) can all be rotationally driven in the same direction or alternately in different directions.
