Abstract (en)

[origin: WO2009112190A1] The invention relates to a computer-implemented method, system, and computer program product for dynamically integrating a geographic map representation and a schematic map representation. The method comprises: providing a geographic map representation have one or more starting positions associated with one or more destinations in a schematic map representation; calculating an interpolating and continuous display function by applying a warping method in connection with a method for monitoring overlap to the starting positions and the destinations; and displaying a dynamic or interactive integrated map representation by dynamically applying the display function to the geographic map representation and/or the schematic map representation so that each map representation is distorted according to a selected distortion factor, wherein the integrated map representation represents at least elements and/or parts of both the geographic map representation and the schematic map representation, independent of the selected distortion factor.
