Abstract (en)

[origin: EP2270238A1] The cooling bed useful as an upwardly opened basin (1) for slags, comprises a unit for producing a coolant flow in a longitudinal direction of the cooling bed, where the production unit comprises a gradient in the longitudinal direction of the cooling bed from a slag application point to an end of the cooling bed and the gradient is 3-2[deg]. The unit includes a unit (3) for impacting the slag with the coolant in the area of the slag application point, and a unit (5) for reguiding the coolant from the end of the cooling bed to the impacting unit. The reguiding unit comprises a cleaning unit (6). The cooling bed useful as an upwardly opened basin (1) for slags, comprises a unit for producing a coolant flow in a longitudinal direction of the cooling bed, where the production unit comprises a gradient in the longitudinal direction of the cooling bed from a slag application point to an end of the cooling bed and the gradient is 3-2[deg]. The unit includes a unit (3) for impacting the slag with the coolant in the area of the slag application point, and a unit (5) for reguiding the coolant from the end of the cooling bed to the impacting unit. The reguiding unit comprises a unit (6) for cleaning the coolant and a pump basin, where the cleaning unit comprises a decanter and a mechanical filtering device. The basin consists of concrete, where steel slabs (2) are inserted into the concrete in the area of the slag application point. A metallic or ceramic wear protection is introduced on the steel slabs. A casting bed is arranged upstream to the cooling bed for mixing the fresh slags with cooled slags. An independent claim is included for a method for cooling the slags.
