Abstract (en)

Apparatus (10) for compensating for the emission decay of lamps, particularly for ultraviolet tanning lamps and the like, that comprises - at least one device (11) for modulating the electric power supply of at least one lamp (12) that is functionally connected thereto, the device being connected to the electrical mains (13), - at least one device (14) for logging the accumulated electric power supply time of the modulation device (11), the accumulated time having elapsed from the last replacement event of the lamp (12) or from the last reset event of the accumulated time, - at least one module (15) for control of the modulation device (11), which is functionally connected thereto in order to drive it to supply with electric power the lamp (12) with a power that varies in steps at least upon reaching targets of the accumulated time, the accumulated time information being transmitted by the logging device (14) to the control module (15), to which it is functionally connected.
