Abstract (en)

[origin: WO2009133584A1] An optimized transformer (1), in particular for carrying out dielectric tests, comprising a containment case (2) which is placed on a support structure, a magnetic core (3) placed inside the containment case (2), a primary winding (4), coupled with the magnetic core (3) and a secondary winding (6), magnetically coupled with the primary winding (4) through the magnetic core (3). At least one between the primary winding (4) and the secondary winding (6) comprises a plurality of layers (8) facing one another, defining linear directions (Y) substantially parallel each other, each layer (8) including a plurality of elementary coils independent one from another, electrically connected each other.
