Abstract (en)

[origin: WO2009122076A2] The invention relates to a device for preventing the reestablishment of an electric arc between two adjacent parts, which have been stripped of electrical insulation (11, 14, 12), of at least two electrically conductive elements (13), characterized in that the device comprises at least one part (29) that is made of a dielectric material, said part having at least one through-opening (30) for accommodating at least one of said two electrically conductive elements (13) so that the same surrounds at least one of said stripped adjacent parts (11, 14, 12) of said at least two electrically conductive elements (13).
