Abstract (en)

A plurality of winding units (2), each including a spooling main body (5) rewinds a yarn of supplying bobbin (B) into a package (P) and a supporting body (6) which supports the spooling main body, are arranged next to one another. A curved surface (20) of the supporting body (6) has an alarm lamp (25) which is capable of indicating an operational state of a winding unit. Such a structure allows an operator who is far away from one winding unit in a direction in which the winding units are arranged next to one another to recognize the operational state of the winding units easily. (Fig. 4).
