Abstract (en)

[origin: EP2275370A1] The method involves transporting printed products with a conveyor device with transport clips that are driven in a conveying direction (F). The printed products are supported at an edge region of the printed products. An opening element (72) revolving along a closed movement path is moved in between consecutive printed products, where the opening element engaged on the printed products in a holding region lies behind the edge region in the conveying direction, and firmly holds and pulls out a product part of a holding element. An independent claim is also included for a device for opening and further-transport of printed products.
