Abstract (en)

[origin: WO2009125159A2] The invention relates to a trimming method for a building facade, according to which a primary perforated receiver (50) is placed remote from a second receiver (51) mounted onto the structure of said building or constituting the same, by providing, between said second receiver (1) and said perforated first receiver (50), an air circulation channel (3). The method is characterized in that said first detachable perforated receiver (50), comprising a flexible sheet (203) or constituting the same, is selected. The invention further relates to a hollow panel (1) for implementing said method. The invention also relates to a condenser (110) designed to constitute said second receiver (51) for implementing said method. The invention further relates to a device for attaching and powering (201) a flexible sheet (203) designed so constitute said first receiver (50) for implementing said method.
