Abstract (en)
[origin: EP2280503A2] The method involves providing an algorithm for computing time slot information (3) for time slots to transmit the data packets. The time slots have irregular distance from one another. The time slot information is generated using the algorithm in the control center. The generated time slot information is transmitted to transmitting- or receiving devices (1a,1b). The transmitting- or receiving devices are provided in missiles (F1,F2). The missiles are started and the data packet is transmitted from the transmitting- or receiving devices to another transmitting- or receiving device (2).
