Abstract (en)

[origin: WO2009130367A1] The method described in this invention allows a new way of regulating the pH conditions and microbial balance of the small intestine and the entire intestinal channel through facultative anaerobic bacteria, making it possible for this regulation to be based on the use of measurement data obtained from the system. This may be particularly significant in the prevention of various illnesses and obesity, as well as in maintaining a good state of health.
