Abstract (en)
[origin: WO2009143943A1] The invention relates to a handheld medical device having a bistable display device (3) that is preferably supplemented by an additional display device (2). The invention further relates to the use of a display device (3) having a display area that has a touch panel configured as a matrix of sensors, which are coupled to image segments of the display area and detect a touching of the display area, for a handheld medical device, wherein the sensors, by being coupled to image segments of the display area, affect a change of the representation of touched regions of the display area.
