Abstract (en)
Supplementary data associated with a broadcast transmission (5, 26) is made available to the viewer by identifying the content currently being received at a user terminal 2. The user generates a request for data which includes the identity of the broadcast content. This request is transmitted from the user terminal 2 to a content provision platform 4. The content provision platform retrieves supplementary data associated with the identified broadcast content and delivers the supplementary data to a predetermined return address 9.
