Abstract (en)

[origin: WO2009123576A1] A platform is foreseen according to the invention by which an elastically deformable base plate (11) is adapted to receive a front positioning plate (12) as well as a rear positioning plate (13), which are both positioned on the base plate (11) depending on each desired position of both assemblies (71, 72) of a ski binding (7). Since the platform should allow a freely bending of a ski (5) by enabling simultaneously an efficient dampening of vibrations, a front bearing plate (2) is foreseen on the front positioning plate (12) for the purposes of bearing a front assembly (71) of the ski binding, and is attached to the front positioning plate by means of a pair of levers (21, 22), which are pivotally connected to the positioning plate and to the bearing plate. A rear bearing plate (3) is foreseen on the rear positioning plate and is attached to the rear positioning plate by means of a pair of levers (31, 32), which are pivotally connected to the positioning plate and to the bearing plate.
