Abstract (en)  
[origin: WO2009151336A1] Mooring device for boats comprising two main parts, the first being a tug and stretch damper part (5) wholly or partly made in an elastic material and being fixed to a foundation (6), for example a quay, so that it stands approximately vertically. Furthermore tug and stretch damper part (5) may be hollow so that the other main part, a mooring line (2), can be thread in and out of it. The mooring line (2) may extend and/or be attached in different ways, in order to allow the mooring desired degree of elasticity. The mooring device (1) will lower the risk of causing injuries to persons and/or causing material damages when a boat is moored.
