Abstract (en)
[origin: WO2009132746A1] A tamping machine that is especially designed for packing tie sections comprises two internal and two external tamping units (13, 24). Each external tamping unit (24) can be pivoted relative to a guide block (25) about a swivel pin (26) extending in the longitudinal direction of the machine and is connected to a swiveling drive (27), the guide block (25) being movably connected to transverse guides (12) and to a transversely sliding drive (14). Tamping tools (18) of the external tamping unit (24) can thus be placed at a maximum distance from the center (23) of the machine in order to largely pack a branching stretch of rails.
