Abstract (en)

[origin: WO2009151390A1] The present invention describes product and analysis method for analysis of a substance, a virus, a bacteria or a cell which binds to carbohydrate structures. One or more carbohydrates, or carbohydrate derivatives, is bound to spherical or non-spherical polymer beads (for example microspheres or nanospheres). Formed carbohydrate-polymer beads or carbohydrate-polymer particles, can bind to with more or less specific affinity to the substance, bacteria, virus or cell which shall be detected. The carbohydrate beads is contacted with a sample containing the substance, bacteria, virus or cell (completely or partially isolated, or not purified, in a non-diluted or diluted solution). The resulting mixture is optionally added to a gel, or a column containing a gel, through which the resulting mixture (of carbohydrate beads or carbohydrate particles bound to the substance, virus, bacteria or cell), is allowed to migrate. Detection of aggregates is made visually or using apparatus for detection.
