Abstract (en)

[origin: EP2287426A1] The arrangement (1) has a lock transferrable from a locking state into a release state by a release device and from the release state into the locking state by a locking device. A clampable energy storing unit of a drive device for a connecting rod (6) is arranged at a side of a covering element i.e. overlap rail (2). The energy storing unit drives the connecting rod with an actuating movement, where the connecting rod is arranged on the side of the covering element. The connecting rod is designed as a loading element, and the energy storing unit is designed as a compression spring.
