Abstract (en)  
The channels of a plurality of two-channel amplifiers are grouped into channel groups in response to a grouping operation. When one of the amplifiers is selected, an amplifier detail screen having two elements corresponding to the two channels is displayed. Acquired operation data or level data are displayed via the two elements. In response to a channel selecting operation one channel of an amplifier among a plurality of channels of the amplifiers is selected and a channel detail screen displayed, on which only one of two elements is placed while the other element is vanished or invalidated. In response to a group selecting operation a first group detail screen is displayed, on which two elements are placed. Data is acquired independently for each of the two channels to obtain two visual data for the two channels. If a selected group contains only one of the two channels, a second group detail screen is displayed, on which one element corresponding to the one channel is placed.
