Abstract (en)

[origin: CA2722019A1] The invention relates to a device comprising a burner holding device for burners that are arranged on an entrained bed gasification reactor. The burners (4,5) are maintained in the burner holding device (7) and extend through a flange (11) that secures the burner holding device (7) to the entrained bed gasification reactor (8), and through the burner holding device (7) in the entrained bed gasification reactor (8). Said cooling device comprises at least two cooling circuits (1,2) that are independent of each other, one cooling circuit (1, 2) being at least partially associated with each burner (4, 5) in such a manner that each burner (4,5) is surrounded by one section of the cooling device on one end that faces the front surface, and at least one cooling circuit (1, 2) is at least partially associated with the front surface for cooling. The burners (4, 5) are also surrounded, below the flange (11), within the burner maintaining device (7), from top to bottom, by a layer (19) made of an insulating casting compound that is fireproof upto at least 800 °C and has a thermal conductivity in the region of between 0.02 - 0.8 W/m K, a layer made of bulk material (17) that is fireproof upto at least 800 °C and a layer (18) made of a thermally conductive casting compound that is fireproof upto at least 1800 °C and has a heat conductivity of 3-15 W/m K.
